

Raddlebarn Primary and Nursery School

Written Method Calculation Policy (Y1 - 6)

Multiplication

Approved: April 2024 To be reviewed: April 2025 At Raddlebarn Primary and Nursery School we follow White Rose Maths for our teaching of maths, therefore the calculation policy is in line with this scheme of work and uses the models and images outlined in White Rose Maths lessons.

This document is broken down into addition and subtraction, and multiplication and division.

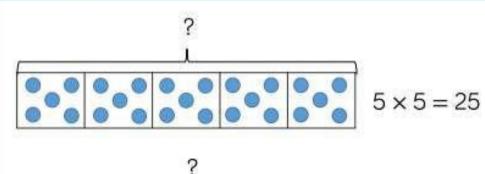

At the start of each policy, there is an overview of the different models and images that can support the teaching of different concepts. These provide explanations of the benefits of using these models and shows links between different operations.

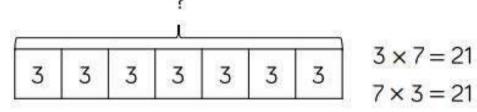

Each operation is then broken down into skills and each skill has a dedicated page showing the different models and images that are to be used to effectively to teach that concept. At Raddlebarn, we have chosen 'Bar Modelling' as our primary problem-solving tool.

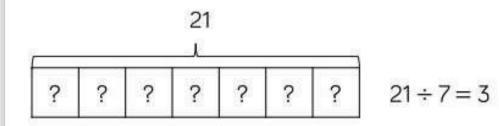

There is an overview of skills linked to year groups to support consistency throughout Raddlebarn. A glossary of terms is provided at the end of the calculation policy to support the understanding of key language used to teach the four operations.

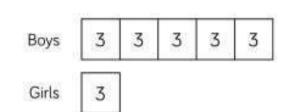

The teaching of times tables is taught within maths lessons. Within this policy it has models and images that are used to explicitly teach the times tables. We also use an online platform called 'Times Table Rockstars (TTRS) to aid the teaching of times tables. Children are encouraged to use this at home and in class.

Bar Model

Benefits

Children can use the single bar model to represent multiplication as repeated addition. They could use counters, cubes or dots within the bar model to support calculation before moving on to placing digits into the bar model to represent the multiplication.

Division can be represented by showing the total of the bar model and then dividing the bar model into equal groups.

It is important when solving word problems that the bar model represents the problem.

Sometimes, children may look at scaling problems. In this case, more than one bar model is useful to represent this type of problem, eg. There are 3 girls in a group. There are 5 times more boys than girls. How many boys are there?

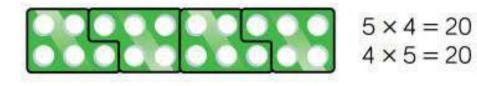

The multiple bar model provides an opportunity to compare the groups.

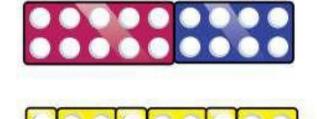

Number Shapes

$$5 \times 4 = 20$$

 $4 \times 5 = 20$

Benefits

Number shapes support children's understanding of multiplication as repeated addition.

Children can build multiplications in a row using the number shapes. When using odd numbers, encourage children to interlock the shapes so there are no gaps in the row. They can then use the tens number shapes along with other necessary shapes over the top of the row to check the total. Using the number shapes in multiplication can support children in discovering patterns of multiplication e.g. odd × odd = even, odd × even = odd, even × even = even.

When dividing, number shapes support children's understanding of division as grouping. Children make the number they are dividing and then place the number shape they are dividing by over the top of the number to find how many groups of the number there are altogether e.g. There are 6 groups of 3 in 18.

Bead Strings

$5 \times 3 = 15$	$15 \div 3 = 5$
$3 \times 5 = 15$	10.0-0

$5 \times 3 = 15$	$15 \div 5 = 3$
$3 \times 5 = 15$	$10 \div 0 = 0$

$4 \times 5 = 20$	$20 \div 4 = 5$
$5 \times 4 = 20$	20.4-0

Benefits

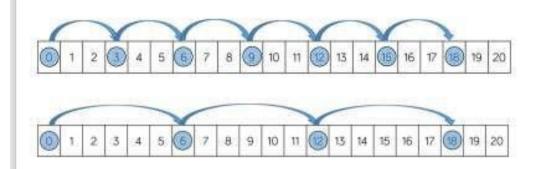

Bead strings to 100 can support children in their understanding of multiplication as repeated addition. Children can build the multiplication using the beads. The colour of beads supports children in seeing how many groups of 10 they have, to calculate the total more efficiently.

Encourage children to count in multiples as they build the number e.g. 4, 8, 12, 16, 20.

Children can also use the bead string to count forwards and backwards in multiples, moving the beads as they count.

When dividing, children build the number they are dividing and then group the beads into the number they are dividing by e.g. 20 divided by 4 - Make 20 and then group the beads into groups of four. Count how many groups you have made to find the answer.

Number Tracks

$$6 \times 3 = 18$$

 $3 \times 6 = 18$

 $18 \div 3 = 6$

Benefits

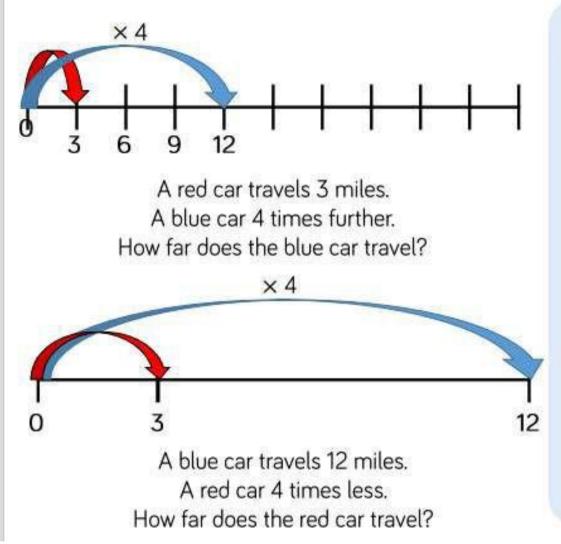

Number tracks are useful to support children to count in multiples, forwards and backwards. Moving counters or cubes along the number track can support children to keep track of their counting. Translucent counters help children to see the number they have landed on whilst counting.

When multiplying, children place their counter on 0 to start and then count on to find the product of the numbers.

When dividing, children place their counter on the number they are dividing and the count back in jumps of the number they are dividing by until they reach 0. Children record how many jumps they have made to find the answer to the division.

Number tracks can be useful with smaller multiples but when reaching larger numbers they can become less efficient.

Number Lines (blank)

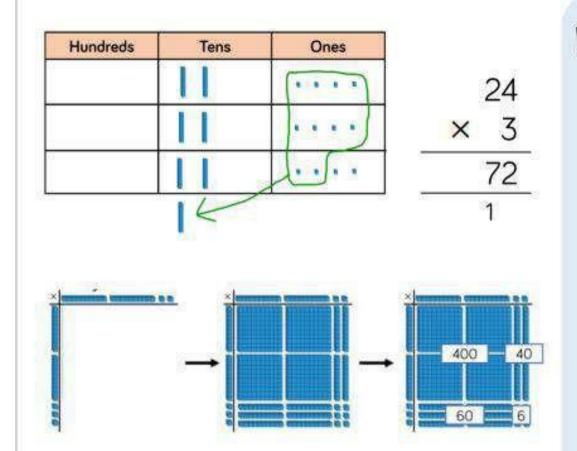

Benefits

Children can use blank number lines to represent scaling as multiplication or division.

Blank number lines with intervals can support children to represent scaling accurately. Children can label intervals with multiples to calculate scaling problems.

Blank number lines without intervals can also be used for children to represent scaling.

Base 10/Dienes (multiplication)

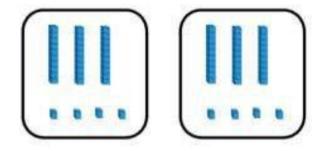

Benefits

Using Base 10 or Dienes is an effective way to support children's understanding of column multiplication. It is important that children write out their calculation alongside the equipment so they can see how the concrete and written representations match.

As numbers become larger in multiplication or the amounts of groups becomes higher, Base 10 / Dienes becomes less efficient due to the amount of equipment and number of exchanges needed.

Base 10 also supports the area model of multiplication well. Children use the equipment to build the number in a rectangular shape which they then find the area of by calculating the total value of the pieces This area model can be linked to the grid method or the formal column method of multiplying 2-digits by 2-digits.

Base 10/Dienes (division)

$$68 \div 2 = 34$$

Tens	Ones
11	
	10. E. M.
1	

$$72 \div 3 = 24$$

$$72 + 3$$

= 24
 $60 + 3$
= 20
 $12 + 3$
= 4

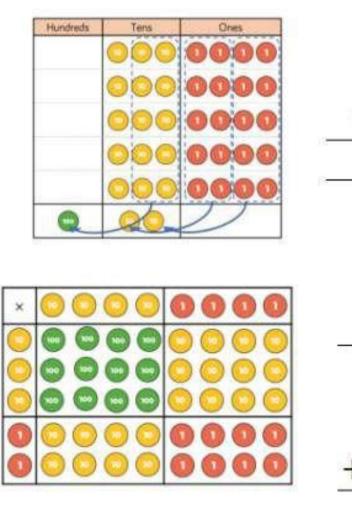

Benefits

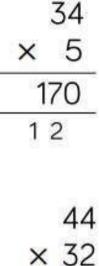

Using Base 10 or Dienes is an effective way to support children's understanding of division.

When numbers become larger, it can be an effective way to move children from representing numbers as ones towards representing them as tens and ones in order to divide. Children can then share the Base 10/ Dienes between different groups e.g. by drawing circles or by rows on a place value grid.

When they are sharing, children start with the larger place value and work from left to right. If there are any left in a column, they exchange e.g. one ten for ten ones. When recording, encourage children to use the partwhole model so they can consider how the number has been partitioned in order to divide. This will support them with mental methods.

Place Value Counters (multiplication)

8

80

120

1200

1408

1

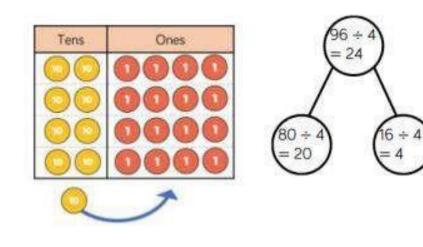

Benefits

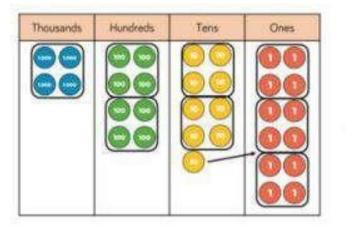

Using place value counters is an effective way to support children's understanding of column multiplication. It is important that children write out their calculation alongside the equipment so they can see how the concrete and written match.

As numbers become larger in multiplication or the amounts of groups becomes higher, Base 10 / Dienes becomes less efficient due to the amount of equipment and number of exchanges needed The counters should be used to support the understanding of the written method rather than support the arithmetic.

Place value counters also support the area model of multiplication well. Children can see how to multiply 2-digit numbers by 2-digit numbers.

Place Value Counters (division)

1223

Benefits

Using place value counters is an effective way to support children's understanding of division.

When working with smaller numbers, children can use place value counters to share between groups. They start by sharing the larger place value column and work from left to right. If there are any counters left over once they have been shared, they exchange the counter e.g. exchange one ten for ten ones. This method can be linked to the part-whole model to support children to show their thinking.

Place value counters also support children's understanding of short division by grouping the counters rather than sharing them. Children work from left to right through the place value columns and group the counters in the number they are dividing by. If there are any counters left over after they have been grouped, they exchange the counter e.g. exchange one hundred for ten tens.

Year: 3

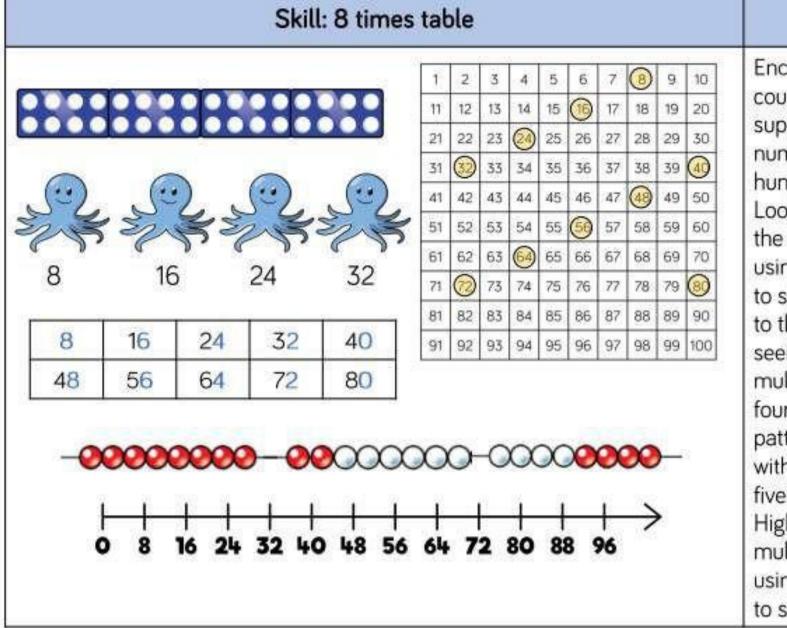

Encourage daily counting in multiples both forwards and backwards. This can be supported using a number line or a hundred square.

Look for patterns in the three times table, using concrete manipulatives to support. Notice the odd, even, odd, even pattern using number shapes to support. Highlight the pattern in the ones using a hundred square.

Encourage daily counting in multiples, supported by a number line or a hundred square. Look for patterns in the four times table, using manipulatives to support. Make links to the 2 times table, seeing how each multiple is double the twos. Notice the pattern in the ones within each group of five multiples. Highlight that all the multiples are even using number shapes to support.

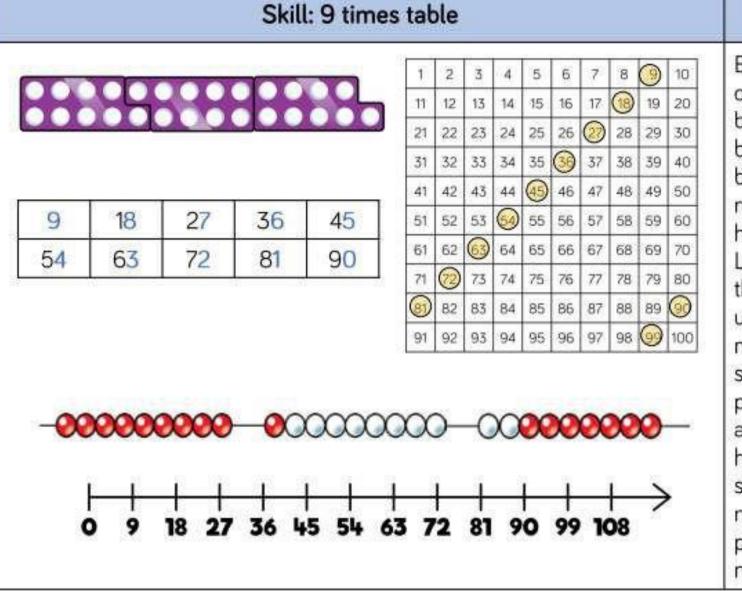

Year: 3

Encourage daily counting in multiples, supported by a number line or a hundred square. Look for patterns in the eight times table, using manipulatives to support. Make links to the 4 times table, seeing how each multiple is double the fours. Notice the pattern in the ones within each group of five multiples. Highlight that all the multiples are even using number shapes to support.

Multiply 2-digit by 3- digit numbers	5	Place value counters	Short written method Grid method							
Multiply 2-digit by 4- digit numbers	5/6	Formal written method								

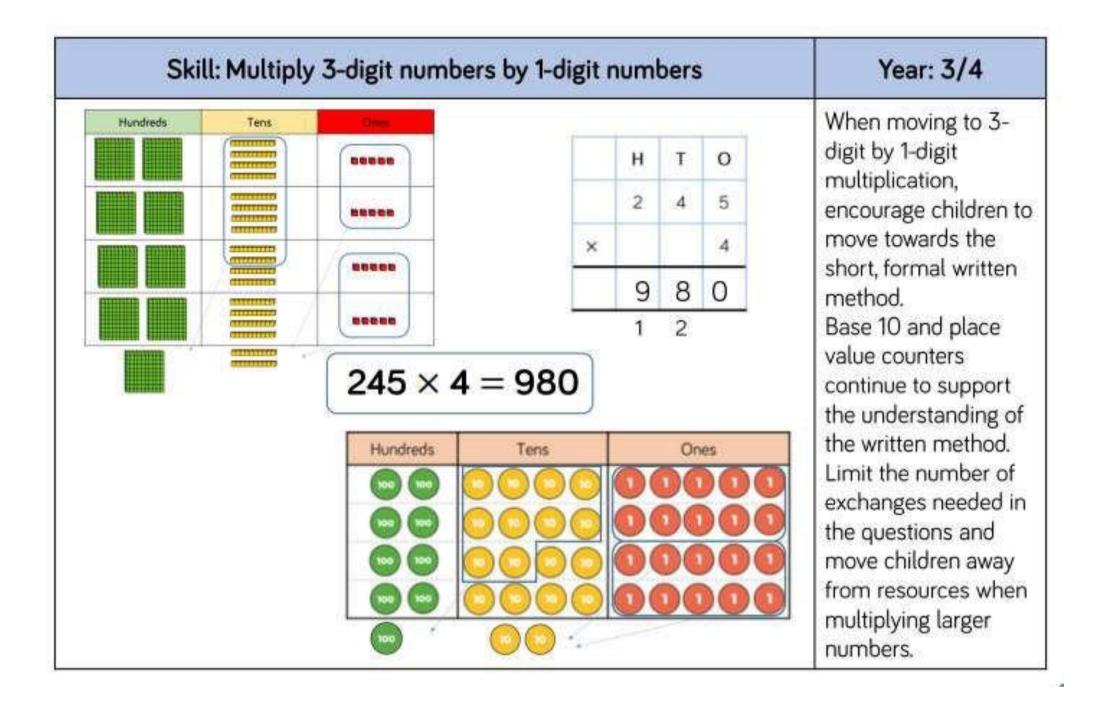

By the end of Year 1, children at expected standard will use concrete and pictorial representations to solve multiplication problems.

By the end of Year 2, children at expected standard will be introduced to the multiplication symbol and recognise the abstract form e.g $4 \times 5 = 20$

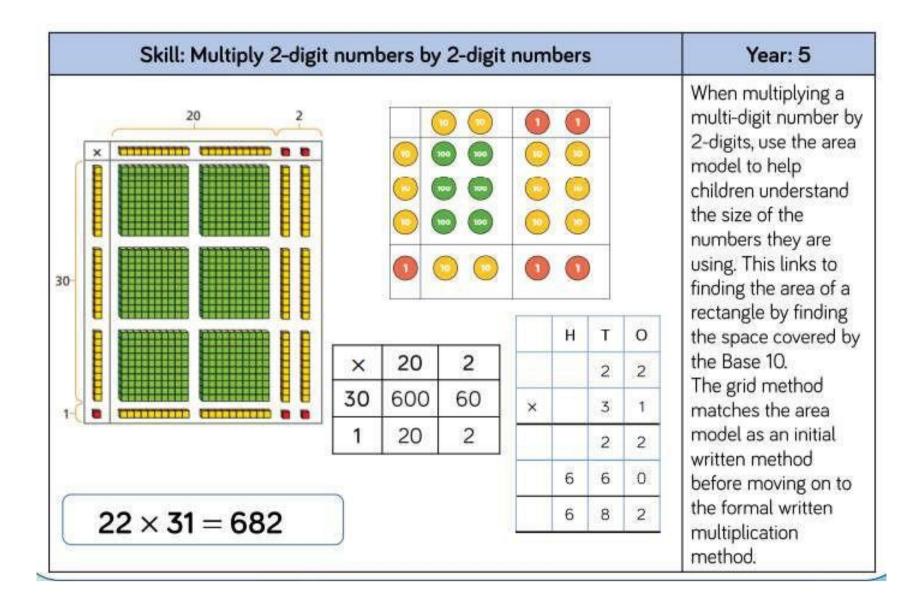

By the end of Year 3, children at expected standard will be secure with the expanded written method **By the end of Year 4**, children at expected standard will be secure with the short-written method.

Skill: Multiply	4-digi	Year: 5					
	1,826		© © 3 =		,47	8	When multiplying 4- digit numbers, place value counters are the best manipulative to use to support children in their understanding of the formal written method. If children are multiplying larger numbers and
		Th	н	т	0		struggling with their
	-	1	8	2	6		times tables,
	×				3		encourage the use of multiplication grids so
		5	4	7	8		children can focus on
	-	2		1			the use of the written method.

By the end of Year 5, children at expected standard will be secure with the short-written method multiplying 4 digits by 1-digit numbers.

By the end of Year 5, children at expected standard will be secure with the short-written method of multiplying 2 digits by 2 digits.

Skill: Multiply 3-digit nu	Year: 5							
			Th ×	H 2 4	T 3 3 6	0 4 2 8	Children can continue to use the area mode when multiplying 3- digits by 2-digits. Place value counters become more efficient to use but Base 10 can be used
